

GIS Portal

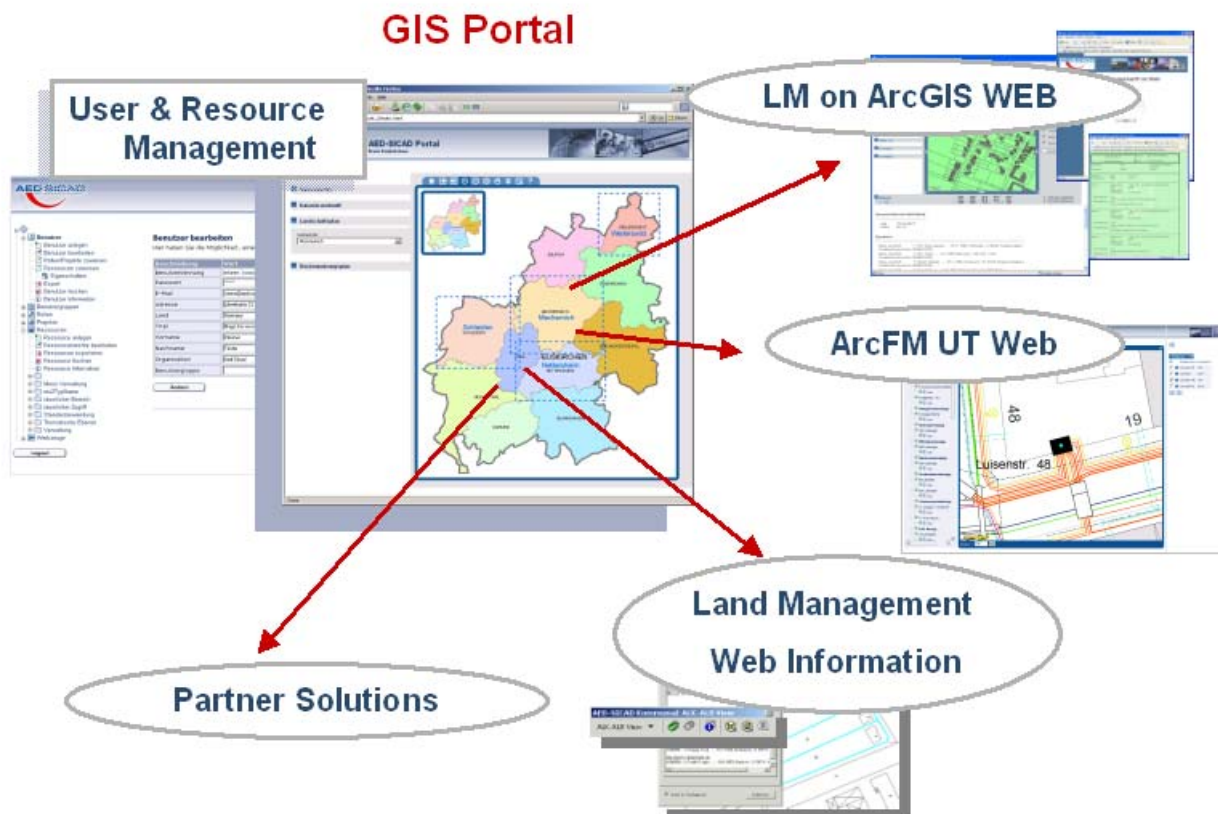

Integrated Web Base for all Branch Applications

AED-SICAD's GIS Portal offers you a comfortable and integrated access to the multi-branch application environment and – of course – to the various datasets connected to it. Thus, any of your employees has the same access to the technical applications that have been assigned to him depending on his tasks and specific rights. The user rights are managed by the integrated User & Resource Management by AED-SICAD.

Would you like to access all your different Web applications via a uniform user interface? The necessary data, functions and branch-specific information should automatically be made available depending on the job profile to guarantee a more efficient workflow.

The **GIS Portal by AED-SICAD** controls all these processes and allows a decentral access to your data - exactly the way you want it.

The Portal provides access via general address indications as well as detailed objects and geographical locations. Targeted navigation to a selected location or area without losing track is possible by means of geographical maps as well as via address. According to your wishes or requirements, the Portal pages can be customized to your individual layout, taking into consideration your Corporate Identity, e.g. own logo, coloring, name.

AED-SICAD offers you Web- as well as desktop-based solutions for all branches. They are made available via the Portal by a common access and a standardized interface.

User & Resource Management

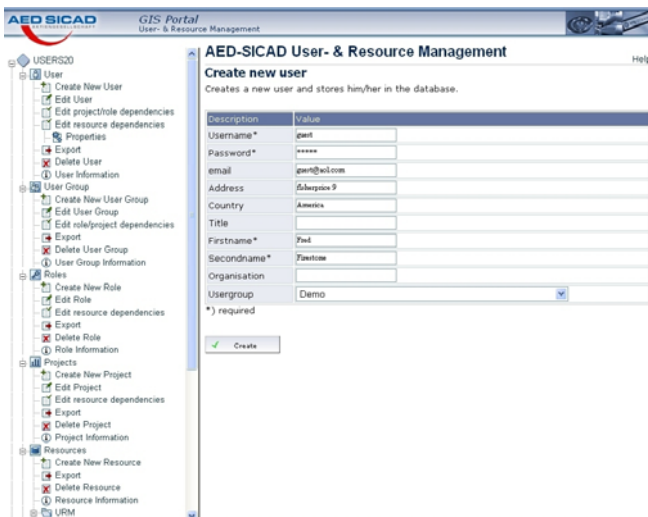

An extensive user right management with role and process model has been integrated to take care of the individual access to the data, which can be customized to your personal requirements.

When accessing your data and resources, it has to be guaranteed, that these are only released for authorized users. The User & Resource Management integrated in AED-SICAD's GIS Portal allows controlled data access for authorized users. The settings are performed via an administration system for rights and roles, which can be centrally managed for each application and each user or user group, respectively, as well as for the corresponding data. At any time, you can control and document who is allowed to view which data.

The configuration options are manifold. Thus, certain roles (for example customer service), procedures or resources can be assigned to single users as well as user groups. This even allows the assignment of totally individual rights – like e.g. allowing the access of certain persons or user groups to defined data, topics, geographically determined data areas, access rights for print services etc.

Your advantages at a glance

- Uniform, integrated application portal for the management of all branch applications
- Standardized navigation services
- Central user & resource management for all Web applications
- Simple alpha data retrieval by means of the Alpha Manager
- Optional platform for e-government processes
